BOSCH SECURE, MULTI-POINT MEGAWATT CHARGING STATION

Long-haul & regional road transport

Static/logistical infrastructure

Solution description

The first secure, flexible MCS Hub at the core of the TEN-T network

The secure, multi-point Megawatt Charging Station at Bosch's site in Karlsruhe is a public charging hub designed to enable fast, simultaneous charging of heavy-duty and light-duty electric vehicles.

This high-power infrastructure supports over 4 MW peak power, integrates 1.2 MW battery storage system, and leverages smart energy and communication systems to ensure secure, interoperable, and efficient operations, making it ideal for high-throughput logistics environments.

Benefits

- **Ultra-fast, high-capacity charging**
Up to 1+ MW per MCS port enables rapid turnaround for both heavy-duty and light-duty electric vehicles, minimizing downtime.
- **Multi-vehicle, multi-port flexibility.**
Supports simultaneous charging of multiple vehicle types with 5 MCS and 18 CCS connectors
- **Secure and with Smart Energy Use.**
A charging facility that meets all EU safety requirements, featuring an integrated battery storage and smart EMS to optimize energy flows

Main beneficiary:
CHARGING POINT OPERATORS

NIGHT 12 HDVs charging in 6 hours

DAYTIME 5 HDVs charging in ≤ 45 minutes

CHARGING SLOTS RESERVATION AND PAYMENT PLATFORM

Long-haul & regional
road transport

Electrification

Solution description

A seamless charging slots booking and payment system

A user-friendly digital interface that allows drivers and fleet operators to reserve, access, and pay for charging slots any type of charging stations.

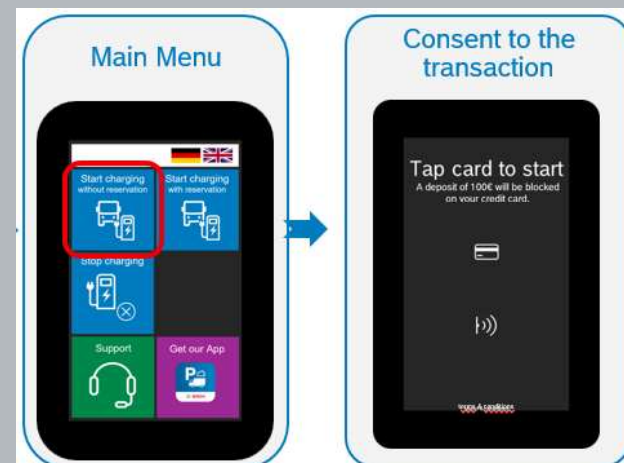

It supports real-time status updates, dynamic pricing, and integration with navigation and fleet management systems, ensuring efficient and predictable use of high-power charging infrastructure.

Benefits

- **Reduced waiting times**
Avoids congestion at busy hubs through guaranteed reservation windows and real-time chargers' availability
- **Optimized charging planning**
Integrated with route planning tools for smooth logistics operations and easy payment
- **Reliable, transparent operations**
Displays charger reliability and reservation status directly to customers, allowing trucks drivers to start and stop their booked or ad-hoc charging sessions

Main beneficiary:
Charging point operators

DYNAMIC ELECTRIC VEHICLES ROUTE PLANNING TOOL

Long-haul & regional
road transport

Transport planning
and execution

Solution description

Dynamic Route Planner for Battery Electric Heavy-Duty Vehicles

A smart route planning tool tailored for **electric trucks and trailers**, enabling fleet operators to calculate the **most efficient route and charging strategy** based on live and predictive data.

It uses physical vehicle models, battery condition, load weight, topography, weather, and live traffic to suggest optimal routes—including **stopovers**, **charging station bookings**, and **dynamic re-routing**.

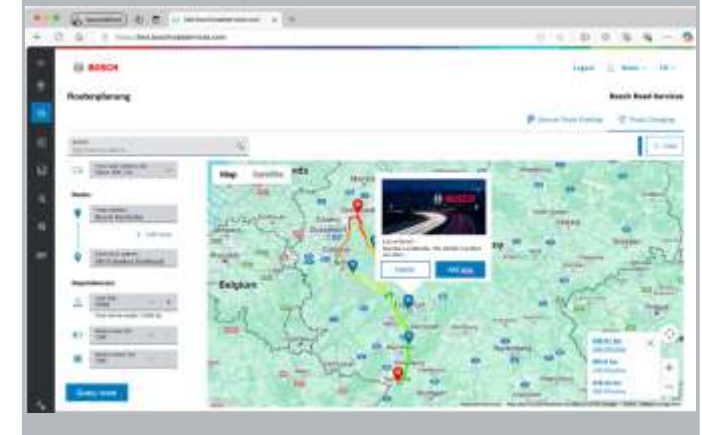

Benefits

- **Optimized, Realistic Route Planning**
Based on topography, distance, battery condition, and cargo weight. Learns from past trips and adjusts plans using real-time data
- **Integrated Charging Strategy**
Identifies available MCS/CCS points along the route and estimates charging duration and energy needs.
- **Seamless Integration via API**
Connects directly to fleet or transport management systems (FMS/TMS) and adapts to vehicle profiles for real-time dispatch optimization.

Main beneficiary:
LOGISTICS SERVICE PROVIDER
and FLEET OWNERS

Route suggestion with SoC indication

INTERACTIVE TRUCK CHARGING STATION FINDER

Long-haul & regional road transport

Static/logistical infrastructure

MACBETH

Solution description

The Site Selection And Optimal Locations Tool for MCS Stations

The first **open-access web-based tool** that **visualizes** and ranks optimal locations for electric truck charging hubs along the European TEN-T network by analysing grid availability, parking and gas infrastructure, and local traffic flows.

This digital tool empowers CPOs, grid operators, fleet owners and infrastructure planners with a data-rich interface to identify strategic, high-potential sites for megawatt charging infrastructure deployment.

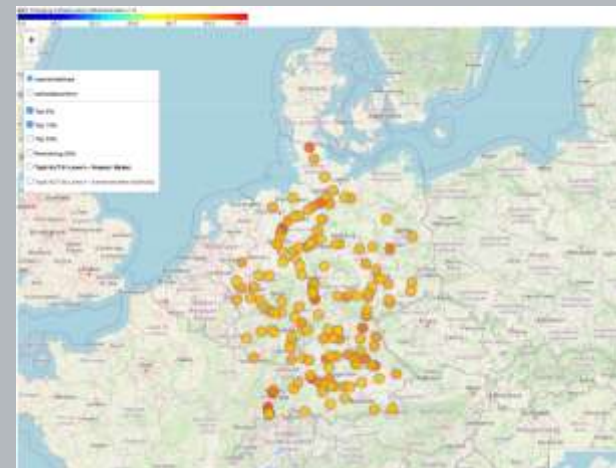

Benefits

- **Interactive GIS-Based Web Tool**
Allows users to explore and compare charging site potential with layered data, speeding up site pre-selection and feasibility studies for MCS hubs.
- **Up-to-Date Data Integration**
Includes current parking/gas station data, medium-voltage grid availability, and demand forecasts.
- **EU Corridor Alignment**
Covers TEN-T corridors with a pan-European vision for infrastructure deployment, directly supporting compliance with AFIR regulation

Main beneficiary:
CHARGING POINT OPERATORS and
GRID OPERATORS

BATTERY ELECTRIC VEHICLE CHARGING

Long-haul & regional
road transport

Automation
(physical) and
robotics

Solution description

An automated charging solution for battery-electric freight vehicles, enabling driverless charging during depot layovers.

Using AI-driven computer vision, patented soft robotics, and remote services, the system manages scheduled energy transfers through automated docking.

Designed for smart charging networks and V2G integration, it streamlines operations by eliminating manual intervention and enabling seamless, safe, and efficient electrification of freight transport.

Benefits

- **Accelerates EV adoption in freight.** An automated system can increase overall EV usage by eliminating the need for a technician at each charge point.
- Importantly, **safety** is improved: by removing humans from the charging process, electrical hazards are mitigated.
- The result is a greener, more flexible freight operation.

Beneficiaries: Fleet operators, depot managers, charging infrastructure providers, energy grid operators, truck OEMs, drivers associations

Technology readiness level : **6-7**
Implementation stage : **Pilot**

Operational fields

Solutions

BATTERY ELECTRIC VEHICLE CHARGING

Long-haul & regional
road transport

Automation
(physical) and
robotics

Demonstration:

- Electric HDVs perform “driverless charging” at a depot. The demo will use planned charging schedules and automated docking so that energy transfer happens seamlessly in a CCAM* chain.
- The charging solution combines AI-based computer vision, patented soft robotics, and remote services to optimize the charging operations in a reliable, safe, and cost-efficient way.

Solution description

A fully automated **hub-to-hub freight transport solution showcasing Level 4 autonomous trucks.**

It enables seamless cargo movement from a distribution centre to the Port of Gothenburg, featuring automated gate access, autonomous public road driving, digital terminal clearance, and self-guided depot charging.

The system integrates communication platforms, Fleet Management Systems, Transport Management Systems, and mobile networks.

Benefits

- Streamlined logistics operations and novel business models.
- Initial assessments show Cooperative, Connected and Automated Mobility (CCAM) vehicles can cut operational costs and support more efficient transport scheduling.
- A fully automated link also enables just-in-time deliveries, increase reliability and reduce mistakes

Solutions

HUB-TO-HUB FREIGHT AUTOMATION

Long-haul & regional
road transport

Automation
(physical) and
robotics

Use Case Germany: Transition from motorway to confined area

This Use case aims to demonstrate the following:

1. Demonstrate Level 4 automation driving on and off public roads.
2. Create and demonstrate gate access services, including request, confirmation & passing based on proper “document” handling.
3. Create and demonstrate a solution for automated loading and unloading of pallets, partly operated by the remote operator.
4. Create a better understanding of how and when the remote and the onboard operator must be involved.

MILENCE MULTI-POINT MEGAWATT CHARGING HUB

Long-haul & regional
road transport

Static/logistical
infrastructure

Solution description

The first next generation safe and secure MDV-HDV charging hub

The secure, multi-point Megawatt Charging Station at Milence's site in Belgium is a charging hub equipped with the latest technological advancements by Power Electronics and designed to enable high throughput capacity, safety, reliability and scalability in limited space.

This high-power infrastructure will be the first one in Europe to feature an innovative robotic technology supplied by Rocsys for the autonomous plugging of the power cables, to improve the safety of operation in MCS hubs.

Benefits

- **Ultra-fast, high-capacity charging**
Up to 1.2 MW per MCS port enables rapid turnaround for both heavy-duty and medium-duty electric vehicles, minimizing downtime.
- **Multi-vehicle, multi-port flexibility**
Supports simultaneous charging of multiple vehicle types with 4 MCS and 14 CCS connectors
- **Safe, efficient and autonomous**
With seamless access control and equipped with robotized solution for autonomous plugging to reduce the time for establishing connection and ensure driver's resting time.

FINDING THE TRUE VALUE OF ROAD AUTOMATION

Long-haul & regional road transport

Automation (physical) and robotics

Solution description

Beyond the use-case demos, MODI project dedicates efforts to new business models and alliances. The project will apply frameworks to define viable CCAM-based services.

In parallel it fosters collaboration among shippers, carriers, vehicle OEMs, infrastructure providers and regulators. The goal is to identify revenue models where fleets of automated trucks deliver added value.

**CCAM: Connected, Cooperative, and Automated Mobility*

Benefits

- New guidelines and tools for CCAM business strategies.
- By project end, MODI will deliver a set of sustainable business models for automated freight chains.
- Results to date indicate CCAM logistics can be highly profitable when vehicles are coordinated.

AUTOMATED TRUCKS MOTORWAY-TO-HARBOUR TRANSITION

Long-haul & regional
road transport

Automation
(physical) and
robotics

Solution description

Automated heavy truck approaching and entering Hamburg port via city roads, operating in mixed traffic. The vehicle follows optimal speed advisories and safety alerts through urban intersections.

The focus is on the **transition from high-speed roads to a confined port environment**. It covers driving on the German autobahn, then on busy urban/industrial roads leading into the port.

Smart coordination features will be deployed, such as, a Green Light Optimal Speed Advisory (GLOSA) system on traffic lights and VRU (vulnerable road user) detection, to smooth this transition.

Benefits

- **Smoother traffic flow and higher safety** on busy port approach roads (e.g. reducing stops at lights and improving pedestrian/cyclist detection).
- Expected outcomes include **reduced congestion and fatigue** on the corridor as Cooperative, Connected and Automated Mobility (CCAM) systems optimize truck timing.

Main beneficiaries:

Motorway operators, traffic management, Roadside Equipment (RSE), On-Board Unit (OBE) manufacturers and vehicles OEMs

Technology readiness level : **6-7**
Implementation stage : **Pilot**

AUTOMATED TRUCKS MOTORWAY-TO-HARBOUR TRANSITION

Long-haul & regional
road transport

Automation
(physical) and
robotics

Use Case Germany: Transition from motorway to confined area

This Use Case aims to demonstrate the following:

1. Verification that an automated vehicle guidance service from a motorway to a confined area through industrial and urban areas is possible and can deliver a benefit in e.g. traffic flow, operation, and the number of drivers required.
2. Verification that automated vehicles are safe for vulnerable road users / other traffic.
3. Development of corresponding generally accepted safety requirements and test procedures specifically for trucks on Level 4 automation and higher.

Solution description

FlexiPack is a modular, reconfigurable battery system designed for battery electric vehicles.

Its compact, stackable architecture enables flexible integration across vehicle platforms, tailored to specific operational missions.

With a scalable energy design and future-proof form factor, it supports process digitalisation and AI readiness.

- Modular Battery Pack for BEVs
- Scalable Energy, Mission-Ready
- Reconfigurable for Any Platform
- Compact, Stackable, Space-Saving

Benefits

- Tailored Performance, On Demand
- Upgrade-Ready, Future-Proof Design
- Maximize green fleet ROI

TwinSphere is a plug-and-play secure Digital Twin designed for zero-emission battery and fuel cell commercial fleets.

It enables **rapid simulation of routes and fleet configurations**, supports scalable deployment from single vehicles to full fleets, and ensures secure, compliant data management for optimised transport planning and execution.

- Plug-and-play Digital Twin for zero-emission battery and fuel cell fleets
- Simulate routes and fleet setups instantly
- Scale from one vehicle to full fleets
- Customize your fleet

Benefits

ZeroPath: RANGE ESTIMATION FOR ZERO-EMISSION TRUCKS

Long-haul & regional
road transport

Electrification

ESCALATE 

Solution description

ZeroPath is an AI-powered solution that delivers accurate, real-time range estimation for zero-emission heavy-duty trucks.

Designed for transport planning and execution, it provides predictive insights to optimise electric vehicle operations.

- AI-Powered Range You Can Trust
- Real-Time Insights, Smarter Driving
- Predictive Range for Heavy-Duty EVs
- Drive Further with AI Precision

Benefits

- Max Range, Zero Guesswork
- Upgrade-Ready, Future-Proof Design
- Maximize green fleet ROI
- Optimized for Real-World Conditions

Main beneficiary:

Vehicle Manufacturers,
Fleet Operators, Tier 1 Suppliers

Power of AI eliminating Range Anxiety

Technology readiness level : **TRL 7**
Implementation stage : **Pilot**

DETERMINING THE RIGHT VEHICLE FOR THE RIGHT DUTY

Long-haul & regional road transport

Digital Twins, AI and predictive technologies

Solution description

An AI-driven solution that automates the selection of suitable EMS vehicle combinations for specific routes.

It uses advanced vehicle dynamics models and **digital twins of both vehicles and infrastructure** to assess feasibility, including swept path analysis for complex manoeuvres such as roundabouts and sharp turns.

Designed for ports, terminals, and logistics operators managing HGV movements.

Benefits

- **Optimised vehicle deployment.** Ensures the most suitable vehicle is assigned to each route, improving efficiency.
- **Enhanced safety and compliance.** Identifies route constraints using digital twins and swept path analysis.
- **Reduced operational costs.** Minimises trial-and-error in route planning, saving time and resources.

Main beneficiary:

All companies involved in the operation of HGVs

Technology readiness level : **7**
Implementation stage :
Pilot

RELIABLE MISSION PLANNING FOR EV TRUCKS

Long-haul & regional road transport

Electrification

Solution description

IT based mission planning tool

IT-based solution enabling realistic mission planning for electric trucks.

By simulating routes with digital twins, it accounts for variables such as weather, terrain, payload, battery status, and traffic.

This ensures accurate calculations of energy consumption, range, and optimal charging strategies for complex, multi-stop logistics operations.

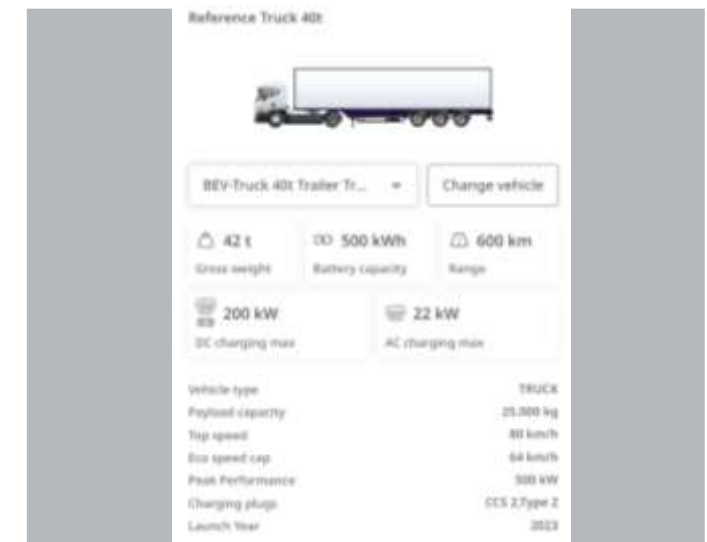

Benefits

- Calculate routes using digital twins of electric trucks and gain insight into how these vehicles operate on the road.
- Calculate energy consumption, range, and optimized charging scenarios for realistic truck routes that include multiple stops with varying payloads, considering weather, elevation, truck restrictions, road traffic, or driver behavior.
- Simulation of different weather conditions, battery aging, or battery condition settings.

Main beneficiaries:

For LSPs and for fleet owners

Technology readiness level : **7**
Implementation stage : **Pilot**

Operational fields

Technologies

Solutions

RELIABLE MISSION PLANNING FOR EV TRUCKS

Long-haul & regional
road transport

Electrification

This solution will help you:

Calculating routes in a realistic scenario, with multi-stop routes, weather truck restrictions etc. provides valuable insights, into which routes are feasible for specific vehicles and which not.

Time to simulate: How does the vehicle behave in winter/summer, with strong headwinds, or if the battery is only half full? Where do you have to place chargers, so routes are feasible, and how long do they have to charge?

Take a photo of this slide and get in touch to learn how we can support your EV fleet planning.

ZERO EMISSION VEHICLE BUYING DECISION TOOL

Long-haul & regional
road transport

Electrification

Solution description

A digital tool designed to support HGV fleet operators and buyers in evaluating the transition to zero-emission vehicles.

It assesses the suitability of different powertrains and calculates operational and capital expenditure to determine the most cost-effective and sustainable options for specific logistics operations.

The tool enables informed decision-making in planning future fleet composition and decarbonisation strategies.

Benefits

- Identifies the most cost-effective zero-emission vehicle options
- Optimises fleet powertrain mix for operational efficiency
- Calculates Total Cost of Ownership, including OPEX and CAPEX
- Supports strategic planning for sustainable fleet transition

Main beneficiaries:

All companies involved in the purchase and/or operation of HGV's

Solution description

The solution provides a secure, controlled, traceable and data governance compliance environment for data exchange using a European Mobility Data Space Connector.

It **automates data transfers** with Apache Airflow, large-scaled data storage is handled by ClickHouse, and enables real-time **visualisation and monitoring via Grafana**.

Each component supports reliable, scalable processing and analysis of mobility and transport data across urban ecosystems.

Benefits

- Integrates multimodal transport data for better coordination
- Secures data exchange with full traceability
- Supports transparent, open data governance
- Enables data-driven urban mobility decisions
- Automates data transfers and updates
- Provides real-time operational insights

Main beneficiaries:

- Municipalities managing urban mobility.
- Public transportation authorities and operators.
- Providers of mobility and transportation services.

URBAN ACCESS CONTROL INTEGRATION IN TRANSPORT PLANNING TOOL

Urban logistics /
Last mile

Traffic and access
management,
navigation

Solution description

A tool for optimizing your transport planning system and route navigation

Urban Access Control (UAC):
create value out of data-sharing
between cities and logistics providers
by **integrating access rules (UVAR)**
in logistics processes.

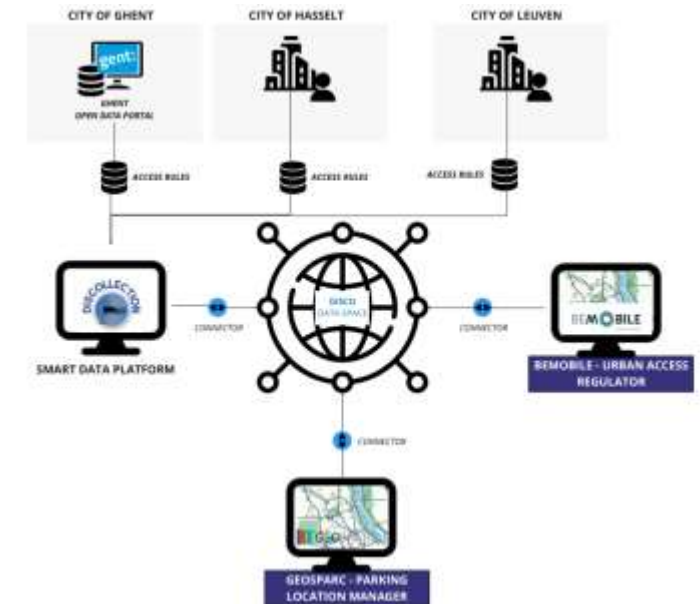

Benefits

The Urban Access Control platform:

- **Integrates access rules** in logistics planning tools
- Calculates and proposes **sustainable alternatives**
- Provides **optimized real-time route navigation** enriched with Points Of Interests (POI)

Main beneficiaries:

Cities, transport planning
systems, transport companies

Technology readiness level : **8**
Implementation stage : **pilot**

Operational fields

Solutions

URBAN ACCESS CONTROL INTEGRATION IN TRANSPORT PLANNING TOOL

Urban logistics /
Last mile

Traffic and access
management,
navigation

Ghent city – Dropon (tms-provider)

- Ghent digitized all access regulations, (un)loading zones, school zones,...
- This data is provided to the dataspace of DISCO
- The UAC platform is also integrated with the dataspace to receive this data.
- The TMS system Dropon is integrated with the UAC, and retrieves the necessary data to make an optimised planning.

=> averagely, in a route of 10km, the UAC warns for no less than 10 dangerous spots and warns for 7 adaptations in vehicle / route planning!

**Implement Urban Access
Control for yourself!**

Solution description

URBAN FREIGHT DATA SPACE

The Urban Freight Data Space (UFDS) is an innovative **data-sharing ecosystem** designed to revolutionize urban logistics by enabling secure, standardized, and collaborative data exchange between various stakeholders.

It promotes data sovereignty, ensuring participants maintain control over their data while benefiting from shared insights. UFDS provides a scalable platform for integrating city-owned and private datasets, enhancing collaboration and operational efficiency in urban freight logistics.

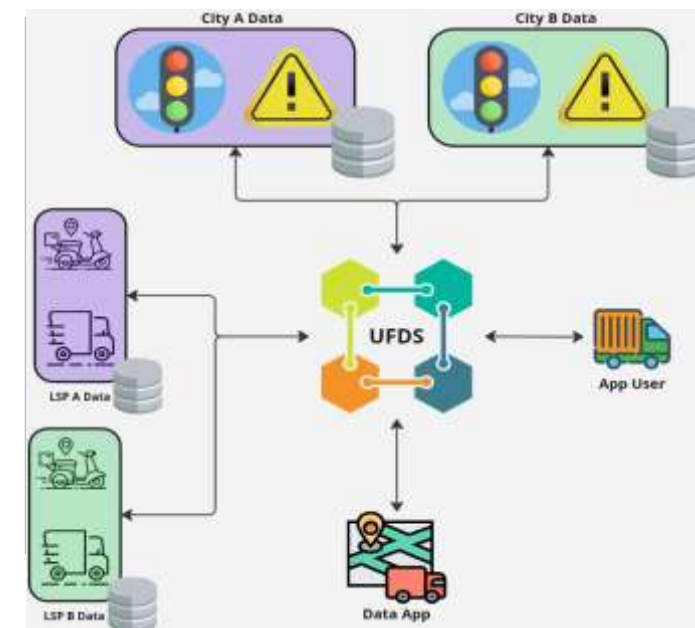

Benefits

- **Collaboration & efficiency:** Connects stakeholders (transport operators, city planners, retailers) for seamless, optimized logistics.
- **Data sovereignty:** Retains data control while enabling shared insights.
- **Standardization & interoperability:** Provides a framework for seamless integration of various data sources and standards, promoting unified operations.
- **Future-proof platform:** Ready for private data integration.

Target Audience & Stakeholders:

- **Beneficiaries:** Transport operators, city planners, retailers, delivery services, municipalities.
- **Data Providers:** City-owned sources (Ghent, Thessaloniki), future private data owners.
- **Users:** Application developers, analysts, logistics companies, city authorities, researchers.

Technology readiness level : **TRL 6-7**

Digital Twins, AI
and predictive
technologies

Solution description

An innovative digital platform for strategic planning of urban logistics hubs.

It integrates **multi-source data** with advanced spatial analytics, offering a **dynamic dashboard**, interactive **map-based data visualisation**, and precision filtering to identify optimal micro-hub locations and improve last-mile delivery efficiency in smart cities.

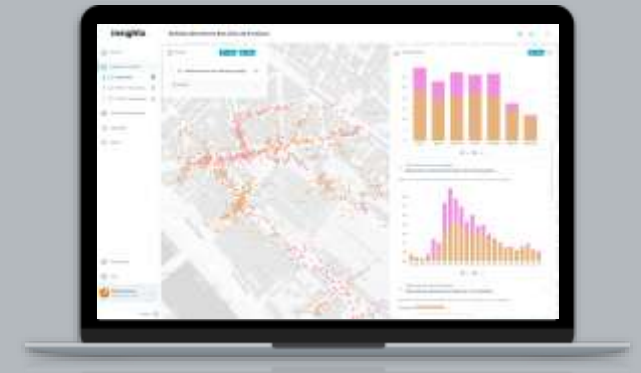

Benefits

- Identifies optimal micro-hub locations with precision
- Enhances efficiency of last-mile delivery
- Reduces urban congestion and emissions
- Supports data-driven urban logistics planning
- Facilitates collaboration among stakeholders
- Improves quality of life in cities
- Enables real-time, location-specific decision-making

Main beneficiary:

Municipalities and urban planners

insights

SMALL FLEXIBLE AUTONOMOUS ZERO-EMISSION VESSEL (SFAZ)

Urban logistics /
Last mile

Automation
(physical) and
robotics

FOREMAST

Solution description

The vessel is less than 20 meters and can sail in estuaries, urban waterways and in shallow waters.

Tight turns can be taken and cargo of different kinds can be (un)loaded.

Autonomous sailing is foreseen and Swarming and Platooning will be a possibility.

Zero-emission by means of hybrid and/or electric energy solutions.

Benefits

- Alternative for (electric) vans/trucks used for urban logistics.
- Use resources more efficiently, cutting energy consumption and emissions
- Reduces congestion in the cities
- Safer urban environment for pedestrians, cyclists,...
- Increase terminal capacity

Main beneficiary:

Cities (and their citizens, visitors) having an exploitable Urban Waterway Network

Technology readiness level : **6**
Implementation stage : **Pilot**

GEOFENCED N1 RIGHT-SIZED VEHICLE

Urban logistics /
Last mile

Transport
planning and
execution

Solution description

Geofenced N1 right-sized vehicles for safe driving in restricted urban areas

Advanced geofencing tools to manage urban logistics more effectively, using open standards already adopted by cities.

Working on vehicle-to-infrastructure connectivity, leveraging IoT and existing digital platforms of IVECO and Alkè that enable real-time monitoring of vehicles locations in the cloud.

This concept extends beyond speed limits in geofencing, to explore various parameters such as specific delivery permissions and load restrictions in those areas.

Benefits

- Offering city authorities and operators a **smarter way to manage logistics in increasingly regulated environments.**
- **Vehicle-to-infrastructure** connectivity enhances **safety and compliance**, with in-cabin alerts that guide drivers in sensitive areas.
- Vehicle passengers' and pedestrians' safety is optimized with 3D-printed components and sustainable materials that reduce emissions.

Main beneficiaries:

Infrastructure manager & operator,
Fleet managers, logistics operators,
car sharing operators

- Smart way to manage logistics
- Enhanced safety
- Increase market penetration of eLCV made in Europe

Technology readiness level : **TRL 7 / TRL 8**

Modularity & standardisation and transhipment

- **Modularity & standardisation (Bergen):** Revealing the e-LCVs movements and allowing for more streamlined interaction with available infrastructure and other road users, while supporting UVAR implementation.
- **Transhipment (Thessaloniki):** Allowing for optimal transportation network design and dynamic traffic management, supporting strategic planning for fleet, space, and operational characteristics of provided service.
- **Transhipment (Bologna):** Responding to the user need for extended time windows for battery EVs in the city centre.

Electrification

Solution description

Electric powertrains offer zero tailpipe emissions, lower operating costs, reduced noise, and smoother acceleration.

They require less maintenance than diesel engines and support sustainability goals, making them ideal for urban transport and environmentally conscious operations.

Benefits

- **Integrated e-axes:** Combination of e-motor, inverters and gearboxes improve efficiency & installation.
- **Advanced regenerative braking systems:** Enhanced energy recovery extends range and reduces wear & tear.
- **Smart thermal management:** Intelligent cooling and heating systems optimised for battery and motor performance across varying load conditions.

Electrification

Solution description

Digital twinning creates a virtual replica of physical assets, enabling real-time monitoring, predictive maintenance, and performance optimisation.

It's a smart, innovative tool driving efficiency and better decision-making across industries.

Benefits

- **Improved maintenance planning:** Real-time monitoring helps predict component wear and prevent unexpected breakdowns.
- **Enhanced energy efficiency:** Simulations optimise route planning and battery usage, reducing operational costs.
- **Faster design iterations:** Virtual testing accelerates development of performance upgrades and customisations.

Electrification

Solution description

Electric medium duty trucks offer a cost-effective urban freight solution by reducing fuel and maintenance costs.

These vehicles allow to omit emissions charges, and potentially benefiting from government incentives.

Benefits

- **Zero Emissions & Reduced Noise:** No impact by access regulations (LEZs & UVARs)
- **Right-Sized for Urban Access:** 18 tons trucks balance payload capacity and manoeuvrability for historic centres & curb side unloading
- **Lower TCO:** Lower maintenance costs and sufficient range (200+km, tested over +6 months) offer competitive long-term savings.

Main beneficiary:
Logistics Providers

"Ships As A Service" ("SAAS")

The service will operate on a **time-charter basis** and include a full-service package encompassing remote monitoring and control, energy bunkering, cargo and port handling, maintenance, and data gathering. The X-Barges are supported by integrated green port infrastructure and energy bunkering systems, enabling seamless operations along inland waterways. The first vessels are expected to be operational by Q3 2026, delivering sustainable and efficient logistics for cargo owners and operators.

Benefits

- Sustainable
- Tackles crew shortages
- Modular energy packs
- Energy efficient design
- Futureproof design
- Reduction/elimination of human error
- Standardisation of risk

DYNAMICALLY OPTIMISED VEHICLE SPACE: DUAL TRANSPORT & CARGO HITCHING

Urban logistics /
Last mile

Asset design,
sharing &
modularity

Solution description

Dynamically optimised space in modular 4-6-seater vehicles for dual transport of goods and people

Introducing an innovative dual-use solution for Alkè's 6-seater vehicle, enabling the transport of up to 6 passengers and goods simultaneously.

With foldable seats and a movable protective partition, the vehicle easily transitions between people and cargo transport - maintaining safety, comfort, and efficiency.

Advanced IoT systems ensure secure rental and operation.

Benefits

- Offering unmatched versatility by combining people and goods transport in a single vehicle.
- Operators can switch functions in real-time, optimizing vehicle use throughout the day.
- By reducing the need for separate vehicles, the solution cuts costs, emissions, and time, supporting more sustainable and agile transport services.

Main beneficiaries:
Fleet managers, OEMs,
logistics operators, car sharing
operators

- Logistics as a service
- Dual transport (freight and people)
- Innovation business model

Technology readiness level : **TRL 7 / TRL 8**
Implementation stage : **Pilot**

MODULAR SWAPPABLE LOAD UNIT CONCEPT

Urban logistics /
Last mile

Asset design &
modularity

Solution description

Modular swappable concept enabling seamless standardised transhipments

An innovative swappable cargo solution designed to streamline package movement across the logistics chain.

Using standardised, modular swap boxes, the system ensures seamless cargo transfers between different vehicle types - ranging from heavy-duty trucks to light electric vehicles and even two- and three-wheelers.

Benefits

- Supporting efficient transhipment at terminals, micro hubs, or vehicle-to-vehicle, aligning with dynamic urban logistics needs and regulations such as LEZs and ZEZs.
- Compatible with different OEMs, it enhances fleet adaptability and facilitates collaborative logistics models.

Main beneficiaries:

- Fleet managers
- Cold-chain operators
- Logistics operators

- Modularity & standardisation
- Seamless transhipment between HDV operations and eLCVs
- Synchromodality to reduce loading and unloading time

Technology readiness level : **TRL 7 / TRL 8**
Implementation stage : **Pilot**

HOLISTIC ENERGY MANAGEMENT FOR ELECTRIC VEHICLES DELIVERIES IN COLD CHAINS

Urban logistics /
Last mile

Electrification

Solution description

Holistic energy management for cold value chain deliveries

Combination of intelligent regenerative braking strategies and advanced tyre technologies to improve vehicle efficiency and reduce non-exhaust emissions. By optimising energy recovery and reducing friction through low-resistance tyres, the solution enhances performance, especially in stop-and-go urban missions.

Digital Twin models support the calibration of braking and tyre systems to minimize particle emissions.

Benefits

- Boosting vehicle efficiency by recovering more energy during braking and reducing rolling resistance through advanced tyres.
- Reducing emissions via optimised brake and tyre systems, while bi-directional charging turns vehicles into mobile energy assets.
- Lowering costs, enabling grid support, and expanding delivery reach.

Main beneficiaries:

Fleet managers, OEMs, cold-chain operators, logistics operators infrastructure providers

- Support cold chain deliveries while serving as energy sources for optimized charging operations.
- Two-way charging capability enabling the charging of smaller vehicles and various logistics tools directly from the EVs.

Technology readiness level : **TRL 7 / TRL 8**
Implementation stage : **Pilot**

MULTI-TEMPERATURE CARGO BODY & OPTIMISED THERMAL COMFORT

Urban logistics /
Last mile

Asset design,
sharing &
modularity

Solution description

Multi-temperature controlled, optimised and energy-efficient cargo body

Integration of movable panels systems and a multi-temperature modular cargo body enabling a solution that can dynamically optimise temperature distribution in the inner compartments using smart sensors integrated with the vehicle's thermal system ensure precise monitoring and control.

Optimised thermal comfort and safe ergonomics in N1 vehicles' cabin

Introduction of an IR Heating Panel, offering a lightweight, energy-efficient solution that quickly heats the cabin to maximise the comfort for drivers and passengers.

Benefits

- Enabling the transport of goods at multiple temperatures in a single trip, increasing delivery efficiency and reducing operational costs.
- Ensuring product integrity, especially for sensitive goods.
- The modular and scalable design allows easy integration into different vehicle types, while energy-efficient technologies support sustainability and lower environmental impact.
- Delivering rapid, even heat distribution for superior passenger comfort with minimal energy use.

Main beneficiaries:

Fleet managers, warehouse owners, cold-chain operators, logistics operators

- Transport dry, refrigerated goods, wines, fresh products;
- Combination of fresh products with parcels through multi-temperature cargo-body;
- Maximise comfort.

SHARED MICRO-HUBS IN CITY CENTRE

Urban logistics /
Last mile

Automation
(Physical) and
robotics

URBANE

Solution description

Shared micro-hubs in city centre

A **micro-hub** in the city centre in Helsinki has been established in order to explore whether the number of vehicles can be reduced, and last-mile deliveries facilitated in city centres that are difficult to reach and with limited access to parking. The micro-hub **supported operations executed by an Autonomous Delivery Vehicles (ADV)** which has an integrated modular parcel locker system.

The goal was to contribute to physical internet by enhancing the collaboration of the ecosystem using a data-driven micro-hub. In addition, it would enable fusing and managing the physical, digital, virtual, emerging technologies, data, people, companies, ideas and business models in a novel way.

Benefits

- **Collaboration:** the micro-hub has been used by big players, e.g. DB Schenker and DHL Express.
- **Use of existing space:** the micro-hub is in a shopping centre and enable
- **Smart contract to ensure data security:** Block-chain enabled smart contracts to protect privacy and commercial interests

Main beneficiaries:

- E-commerce providers
- Logistics service providers
- Operators and owners of parcel lockers, pick-up points and micro-hubs
- Local authorities & real estate owners

With help from Autonomous Driven Vehicles (ADV)

SHARED NETWORK OF PARCEL LOCKERS & MICRO-HUBS

Urban logistics /
Last mile

Collaborative
processes,
connectivity and data

Solution description

Shared parcel locker network can connect all parcel lockers to enable use by various operators

GEL Proximity is a service that allows service providers to make deliveries and returns to Pick-up Points. Likewise, it allows the Networks and possibly also the eCommerce businesses themselves to make their Pick-up Points available and manage the operational flows that a Network of Pick-up Points needs.

The GEL Proximity platform allows integration via dedicated libraries and APIs that can be used by any IT system without limitations. The purpose of GEL Proximity is to make integration with different Pick-up Point Networks simple and unified, internally managing all the complexities of standardizing heterogeneous data and exposing unique and scalable integration methods.

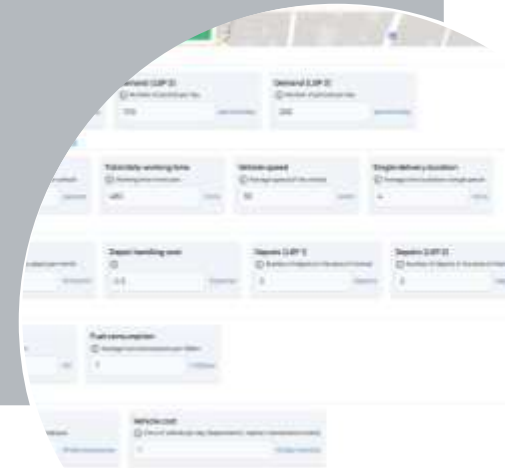

Benefits

- **Automations:** The GEL Proximity platform is designed to manage a high number of transaction volumes efficiently.
- **Importing shipments and returns:** The GEL Proximity system records all requests for confirmation of new shipping or return orders that are made by each Merchant.
- **Smart contract to ensure data security:** Block-chain enabled smart contracts to protect privacy and commercial interests

Main beneficiaries:

- E-commerce providers
- Logistics service providers
- Operators and owners of parcel lockers, pick-up points and micro-hubs

Smart contract to serve as Proof of Delivery:

Solution description

This solution explores and evaluates the implementation of **autonomous technologies in rail shunting operations** within an inland intermodal terminal (MIS terminal).

The goal is to **optimize operational flows in a complex and evolving layout** and assess the adaptability of automation.

Shunting operations are crucial for assembling, disassembling, and positioning trains for intermodal transport.

Benefits

- Increased efficiency and reliability in shunting operations.
- Reduced time for coupling and uncoupling wagons.
- Optimization of locomotive management.
- Improvement of safety.
- Support for the shift towards multimodal logistics.

Solution description

A predictive, data-driven maintenance ecosystem for rail wagons

Using automation, IoT and AI technologies :

- **Smart Gate with Sensors** at the port scans all incoming/outgoing wagons, collecting real-time data for diagnostics.
- **Predictive Maintenance** detects faults before they occur, minimizing unplanned downtime and increasing reliability.
- **Dual Maintenance Locations**

Enabling a shift from reactive to proactive maintenance strategy.

Benefits

- Reduced downtime
- Increased rail freight efficiency
- Optimized asset utilization
- Cost reduction
- Modal Shift towards rail
- Improved service quality
- Data Driven predictive maintenance

Smart Maintenance for Port-Rail Last-Mile Efficiency in Trieste

Inefficient, mileage-based maintenance leads to costly empty wagon trips and frequent unplanned repairs at the Trieste L-Hub.

This use case addresses these issues by implementing data-driven, condition-based predictive maintenance and establishing local repair facilities in Trieste and Gorizia. The goal is to reduce downtime, minimize empty trips, and improve the reliability and capacity of freight operations

NAVIGABILITY & WATER LEVEL FORECASTING SOLUTIONS

Waterborne

Digital Twins, AI
and predictive
technologies

Solution description

Digital twin that combines historical and real-time water level data with weather forecasts to deliver accurate, short- and medium-term predictions of river navigability, especially during extreme weather events.

Expected impacts are numerous:

- Increases efficiency and resilience of inland waterway transport
- Enables better resource deployment during floods or droughts
- Reduces costs from unexpected low or high water events
- Strengthens the competitiveness and sustainability of waterborne logistics

Benefits

- Reliable water level forecasts up to 14 days ahead
- Integrates multiple data sources for high prediction accuracy
- Provides actionable insights for risk mitigation and transport planning
- Essential tool for adapting to climate change impacts on waterways

PREDICTIVE MAINTENANCE & INFRASTRUCTURE MANAGEMENT

Waterborne

Digital Twins, AI and predictive technologies

Solution description

Digital twin for water infrastructures

This system uses sound and radar sensors to constantly check the condition of lock gates and walls.

It works in real time, meaning it always knows what's happening. If it finds signs of damage or wear, it can warn operators before something serious goes wrong.

This helps prevent unexpected breakdowns, makes maintenance easier to plan, and keeps the locks working safely and efficiently.

Benefits

- **Early detection** of mechanical and structural issues of water infrastructures
- **Minimizes unplanned downtime** and costly emergency repairs
- **Automated recommendations and alerts** integrated with planning platforms
- Enables **proactive maintenance strategies**

Main beneficiary:

Infrastructures managers

Lock dashboard

ReNEW
Resilience-centric Smart, Green,
Networked EU Inland Waterways

Solution description

Floating Modular Platform (FMP)

The FMP is a sustainable, modular barge system designed for flexible freight transport and emergency deployment in urban inland waterways.

Comprising AVATAR II and III barges, it features electric propulsion, vacuum mooring for fast, secure docking, and a resilient design validated through CFD, FEM, and seakeeping simulations.

The platform supports green logistics, adapts to extreme events, and enhances climate resilience in line with the European Green Deal.

Benefits

- **Modular, Rapid-Deployment Design**
Enables flexible freight and emergency operations in dense urban areas, with vacuum mooring for fast, secure barge connection - ideal for crisis response and adaptive logistics.
- **Validated Resilience and Safety**
Backed by CFD, FEM, and seakeeping simulations ensuring structural integrity, operational safety, and stability in wave conditions up to 1.2 meters.
- **Zero-Emission, Green Transport Solution**
Fully electric propulsion system supports the European Green Deal by reducing emissions, noise, and road congestion through inland waterway freight mobility.

Main beneficiaries:
Emergency planners, port
operators, disaster response
teams

The Floating Modular Platform is a zero-emission, fast-deployable solution combining green logistics with climate resilience for inland waterways.

Resilience-centric Smart, Green,
Networked EU Inland Waterways

Solution description

Remote Control Centre for Urban Autonomous Barges

A land-based operations hub enabling real-time, **remote piloting of urban autonomous barges** via a secure, multi-layered communication system. It integrates sensor data, high-precision GNSS positioning (GALILEO), and video feeds using Seafar Cloud architecture, 4G/5G, and satellite redundancy.

The system ensures **safe navigation, remote docking, and command continuity** through distributed control centers and a mobile backup unit - enhancing resilience and operational efficiency in dense urban environments.

Benefits

- **High-precision, resilient remote navigation** using GALILEO-based GNSS positioning, 4G/5G with satellite backup, and real-time nautical chart integration—ensuring safe operations even in dense urban waterways.
- **Operational continuity and disaster resilience** through a distributed control setup, including a Mobile Command Center capable of seamlessly taking over vessel operations in the event of system failure.
- **Optimized human and technical resources**, enabling centralized piloting of multiple vessels, reduced onboard crew, and remote docking—delivering efficiency, scalability, and cost savings for IWT operators.

Main beneficiaries:

- Vessel and fleet operators
- RCC solution providers

Deployable Prototype Mobile Command Center for control continuity during system failures/field operations.

Technology readiness level : **7**
Implementation stage : **Pilot**

PORT AUTOMATION: BERTHING & TERMINAL SIMULATION

Ports & airports

Automation
(physical) and
robotics

Solution description

A fully simulated port berthing automation solution evaluating all phases of a vessel's port call: arrival, manoeuvring, berthing, and unberthing.

It integrates autonomous tugboats and an Automated Mooring System at Piraeus Port to model complex operations under varied conditions.

The simulation uses digitalisation and AI to replicate real-world scenarios and assess performance, safety, and operational innovation.

Benefits

- Increased operational efficiency.
- Reduced manoeuvring and berthing/unberthing times.
- Increased port traffic capacity.
- Enhanced safety during critical operations.
- Potential environmental impact reduction.
- Reduction of energy consumption

Main beneficiaries:
Ports, Vessel Operators, Tugboat Operators, Logistics Providers

INTELLIGENT AND AUTOMATED RO-RO PORT TERMINALS

Ports & airports

Digitalisation and
processes
automation

Solution description

This solution demonstrates the benefits of automating port terminal processes through simulation, specifically focusing on operations from vessel arrival to cargo storage.

It covers cargo handling, warehouse operations, and vehicle flows, with a particular focus on Roll-on/Roll-off (Ro-Ro) operations in the Port of Bilbao.

The simulation aims to find an optimal terminal configuration that minimizes inefficiencies and enhances synchronization.

Benefits

- Optimization of operations and transit times.
- Increased efficiency in cargo management.
- Improved synchronization within the logistics chain.
- Reduction of environmental impact.
- Provision of comprehensive forecasts for strategic planning.

Main beneficiaries:
Ports, Vessel Operators, Tugboat Operators, Logistics Providers

DECISION SUPPORT SYSTEM FOR AUTONOMOUS VEHICLES AND RAIL WAGONS IN PORTS

Ports & airports

Digitalisation and processes automation

Solution description

Optimizing intra port movements with autonomous systems

- Use of autonomous vehicles in a controlled closed loop environment
- Use of autonomous rail wagons equipped with linear motors that can move containers autonomously that can operate in small groups instead of full trainsets
- Use of both systems in a hybrid environment with autonomous and manual operated vehicles and trains

Benefits

- 24/7 Operations
- Higher reliability
- Increased Efficiency
- Optimized Asset Utilization
- Cost Reductions
- Improved Safety
- Reduced environmental impact

Main beneficiary:

Strategic Decision Support for T&L Stakeholders

Technology readiness level : **5**
Implementation stage : **Simulation**

DECISION SUPPORT SYSTEM FOR AUTONOMOUS VEHICLES AND RAIL WAGONS IN PORTS

Ports & airports

Digitalisation and
processes
automation

Optimizing Movements Efficiency in the Port of Antwerp-Bruges

Intra-port and intra-terminal movements still often rely on **manual labour and polluting assets**, creating operational inefficiencies and environmental concerns.

In this use case, the DSS calculates the impact of the use of autonomous trucks to reposition containers between a terminal and a depot via a private circuit, and the use of autonomous rail wagons between a terminal and a rail bundle in the port

ENABLING CO-EXISTENCE OF HUMAN AND AUTOMATED TRUCKS IN PORTS & TERMINALS

Ports & airports

Automation
(physical) and
robotics

Solution description

Safely operated **L4 automated and remotely operated trucks** running in existing terminals and port environments.

Automated and human driven operations can co-exist without disrupting terminal activity.

Demonstration and validation is conducted within MODI project by APM terminals, DAF trucks and Port of Rotterdam with support of the Dutch Technology centre, TNO.

Focusing on logistics coordination and support procedures.

Benefits

- Enhance **efficiency and throughput/capacity** at ports/terminals reducing idle time.
- **Lower emissions** (electric trucks) and **fuel consumption** due to optimized container and truck moves
- **Safer operations** by reducing manual yard traffic (expecting overall improved logistics efficiency).

Main beneficiaries:

- Terminal operators
- Port equipment providers

Technology readiness level : **6-7**
Implementation stage : **Pilot**

MultiRELOAD
PORT SOLUTIONS FOR SUSTAINABLE MOBILITY

Solution description

This digital solution improves cargo handling in inland terminals by using camera sensors at the rail gate to capture loading and unloading activities.

It feeds data into a Digital Twin, offering real-time visibility of cargo status and location.

The system also detects and stores the total train length and wagon positions through buffer analysis, enhancing terminal efficiency.

Benefits

KEY BENEFITS	VALUE DRIVERS
Operational efficiency	Faster processing, reduced idle times & automated documentation
Cost savings	Lower manual labor, optimized resource utilization, reduced operational costs
Sustainability	Reduced CO ₂ emissions & energy consumption, rail freight promotion
Safety & Transparency	Real-time tracking, error prevention & more precise planning
Technological Innovation	Digital Twins, camera sensors, seamless IT integration

MultiRELOAD
PORT SOLUTIONS FOR SUSTAINABLE MOBILITY

Solution description

The Multimodal Node Digital Twin is a digital system that helps manage ports more efficiently. It collects data from sensors and port equipment to show what's happening at the port in real-time and in the past.

Using big data and Artificial Intelligence, it can predict future issues and help make smarter decisions.

The system is flexible, can grow with changing needs, and automatically handles data collection, tracking, and analysis to boost efficiency.

Benefits

- Optimised operations & efficiency
- Real-time situational awareness
- Data-driven decision making
- Scalability & adaptability
- Enhanced safety & compliance

MultiRELOAD
PORT SOLUTIONS FOR SUSTAINABLE MOBILITY

Solution description

A cloud-based system is being developed to enable predictive maintenance for inland port/ terminal equipment.

Data from cranes and reach stackers is collected and processed remotely, allowing real-time monitoring without heavy on-site IT infrastructure.

The solution includes sensor-based condition monitoring, automated crane operations adapted to wind conditions to reduce energy use, and optimised control of crane electrical drives.

Benefits

- **Better visibility on equipment assets by anticipating maintenance**
- **Improved uptime**
- **Reduced repair costs**

PIONEERS
Portable Innovation Open Networks for
Efficiency and Emissions Reduction Solutions

Solution description

The Maritime 5G solution provides precise, real-time vessel geolocation within the Port of Barcelona by integrating a 5G network, high-resolution cameras, and advanced artificial intelligence algorithms.

Cameras installed across the port continuously stream live video, which the AI system analyses to pinpoint the exact position and shape of vessels, addressing limitations found in traditional RADAR and AIS systems. This robust combination ensures accurate and immediate vessel tracking, significantly enhancing port operational safety and efficiency.

Benefits

- Precise real-time tracking of vessel positions
- Reliable detection of small vessels, overcoming AIS limitations
- Reduced latency and immediate data availability through 5G connectivity
- Improved port safety and operational awareness
- Enhanced capacity to monitor multiple vessels simultaneously (over 25 at once)

Solution description

The Container Transport Forecast solution utilizes advanced machine learning models to accurately predict inbound and outbound truck movements specifically for SMEs operating within the Port of Barcelona. The predictions are generated using data sourced directly from the Port Community System (PCS), **enabling truck operators to anticipate transportation demands one week in advance**. Additionally, the system optimizes fleet management by automatically allocating transport orders based on criteria such as cost, speed, or environmental impact, thus significantly improving logistics efficiency and planning.

Benefits

- Enhanced efficiency in transport planning and operations for SMEs
- Significant reduction in congestion at port terminals
- Lower emissions due to optimized routing and fleet utilization
- Improved strategic decision-making through precise demand forecasting
- Automation of order allocation, reducing manual planning effort

PIONEERS
Portable Innovation Open Network for
Efficiency and Emissions Reduction Solutions

Solution description

The Port Digital Twin solution integrates diverse data sources into a unified digital platform to enhance visibility and management of port operations, focusing particularly on CO₂ emissions. It includes three practical functionalities: predicting vessel movements to reduce congestion and waiting times, mapping CO₂ emissions to evaluate the effectiveness of emission reduction strategies and optimizing train operations by providing end-to-end visibility of train movements. Additionally, the platform employs AI-based scenario simulations, enabling stakeholders to evaluate the impact of various operational strategies before their actual implementation.

Benefits

- Real-time prediction and avoidance of vessel traffic conflicts.
- Comprehensive tracking and mapping of CO₂ emissions for informed environmental strategies.
- Optimized train scheduling, reducing delays and increasing efficiency.
- Enhanced decision-making through realistic scenario simulations.
- Transferable and scalable solution applicable to other port environments.

DIGITAL MARKETPLACE FOR WAREHOUSE AND STORAGE CAPACITY

Warehousing & fulfilment

Asset design, sharing & modularity

Solution description

The WareM&O platform is a **digital marketplace** where **warehouse** owners can list available spaces and tenants can easily search, compare, and book the capacity they need.

It integrates **e-signatures and blockchain-based smart contracts** for secure, transparent transactions.

By offering **real-time updates on space availability**, the platform enables more efficient and collaborative logistics operations.

API Documentation has been developed and tested to connect the WMSs and Building Management Systems to update the capacities dynamically on the platform.

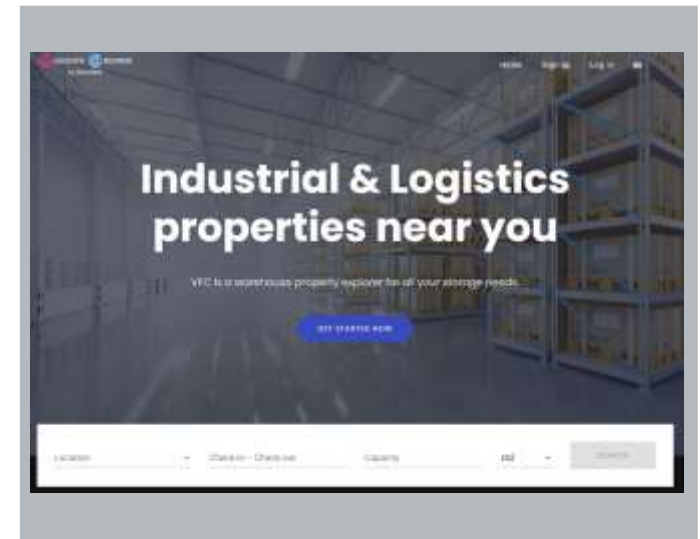

Value drivers:

- **Real-time visibility:** Tenants see up-to-date capacity and pricing.
- **Secure transactions:** Blockchain smart contracts and e-signatures reduce administrative overhead and potential disputes.
- **Scalable collaboration:** Multiple operators can share the same space, lowering costs and reducing wasted capacity.

Main beneficiaries:

- Warehouse Owners and Managers
- Logistics Providers and Couriers
- Retailers and eCommerce Operators
- Local Authorities

DISCOESTATE pilot during the DISCO Project

During the DISCOESTATE pilot, TIF-HELEXPO's underused pavilions, shops, and offices were transformed into logistics hubs using the WareM&O platform.

Real-time capacity tracking, e-signatures, and blockchain-based smart contracts enabled a smooth collaboration between TIF-HELEXPO and ACS Courier, which resulted to the relocation of ACS most important depot reducing congestion in Thessaloniki's historical center. Infrastructure upgrades such as RFID access and around-the-clock operations further streamlined processes, showcasing how large event venues can be repurposed for more flexible, sustainable urban freight solutions.

Interested in learning more or implementing the WareM&O platform for your logistics needs? Contact us to discuss potential collaborations.

Solution description

An innovative automated loading/unloading robotic/AI control solution for automated trucks.

The system enables fully autonomous truck alignment with the bay, loading and unloading without human intervention.

Designed for logistics hubs and autonomous fleets, it showcases the role of digitalisation and automation in enhancing operational continuity and transforming freight handling.

Benefits

- Significant safety and efficiency gains.
- Automated loading eliminates on-site human labor, reducing workplace risk.
- It also enables longer operation times (even 24/7) and supports business cases where manual labor is scarce or expensive.

Beneficiaries: Logistics centers, warehouse operators, fleet operators, cross-docking facilities, truck OEMs, drivers' associations

MultiRELOAD
PORT SOLUTIONS FOR SUSTAINABLE MOBILITY

Solution description

This solution uses simulation and Artificial Intelligence to optimise container positioning in terminals.

By analysing historical data, it predicts the best locations for containers, reducing unproductive movements.

This digital model allows you to test strategies in a virtual environment, improving planning and operational efficiency without disrupting daily operations.

Benefits

- **Reduce unproductive container movements** to lower operational costs
- **Use resources more efficiently**, cutting energy consumption and emissions
- **Increase terminal capacity** by optimising use of higher-level slots

Solution description

The Battery Storage and Smart Energy Management solution integrates a **Battery Energy Storage System (BESS)** with a smart Energy Management System (EMS) to **optimize and monitor the use of renewable energy (wind and solar) in port terminal operations.**

It tracks energy production, analyses real-time usage data, and intelligently manages energy storage to ensure the most efficient and economical utilization of green energy. Additionally, the system enables peak shaving to stabilize the local electricity grid, aligning operational energy consumption with sustainability and regulatory requirements.

Benefits

- Enhanced efficiency in green energy use and storage
- Significant cost reduction through optimized energy dispatch
- Improved grid stability by managing energy demand peaks
- Lower environmental footprint through increased use of renewable energy
- Compliance with energy regulations and sustainability objectives

DIGITAL TWIN-BASED PLANNING FOR MULTIMODAL CORRIDOR AUTOMATION

Multimodality

Transport planning
and execution

Solution description

Simulation-based strategic planning Decision Support tool

- Digital Twins for advanced transport simulation and predictive models
- What-if scenarios
- Optimizing the transport planning of the first and last mile leg of multimodal flows
- Eliminate inefficiencies and losses throughout the entire supply chain

Benefits

- Enhanced Visibility
- Reduction of Waiting Times
- Improved Truck Driver Availability
- Optimized Resource Allocation
- Cost Reductions
- Improved Intermodal Efficiency
- Faster data-driven decisions

Main beneficiary:
Shippers, freight forwarders and
multimodal carriers

Technology readiness level : **5**
Implementation stage : **Simulation**

INFLUENCING TRANSPORT EMISSIONS LEGISLATIVE LANDSCAPE

Multimodality

Measuring and reducing emissions

CLEVER

Solution description

A strategic interface connecting the transport industry with EU regulators, enabling direct engagement with policy developments, early awareness of legislative changes, and active contribution to emissions-related regulations.

- Overview of the key legislative files
- Stay in line with current and future rules
- Stay in contact with key people and stakeholders preparing the legislative files

Benefits

- **Regulatory alignment:** as we get direct contact with regulators and stakeholders
- **Policy influence:** sharing your insights and needs.
- **Awareness of changes:** be on the loop of the latest legislation updates

Main beneficiary:

- Transport industry

Multimodality

Measuring and
reducing emissions

CLEVER

Solution description

An online platform providing **structured access to scientific research, regulatory updates, and expert resources on emission factors** across all transport mode **supporting informed decision-making**.

In the platform you find:

- Relevant initiatives
- Existing and emerging regulatory framework
- Scientific State of the Art
- CLEVER project use cases, reports and recommendations

Benefits

- Enhance your knowledge on Emission Measurement and reporting
- Stay informed on the latest developments: scientific, implementation and policy.
- Be part of an expert community

Main beneficiary:

- Transport industry

What can you find in CLEVER Repository?

- Scientific papers
- Articles
- Key stakeholders in the field (certification, standardization, regulators)
- Updates on regulations related with emission factors
- Deliverables

SYNCHROMODAL CORRIDOR MANAGEMENT SYSTEM

Multimodality

Transport planning
and execution

Solution description

SCMS (Synchromodal Corridor Management System) is an IT platform that collects and shares information on river transport disruptions with operational stakeholders (companies that plan or execute logistics operations in rivers).

It supports planning and re-planning of operations, suggests alternative routes using rail and road, and provides data and analytics to facilitate decision-making and regional policy development.

Benefits

- One single point to get **all river disruption alerts**
- **Forecasts** on river conditions and infrastructure issues
- View **alternative routes** by rail or road

Main beneficiary:

IWT Logistics stakeholders

Technology readiness level : **7**
Implementation stage : **Pilot**

MultiRELOAD
PORT SOLUTIONS FOR SUSTAINABLE MOBILITY

Solution description

The CBoXX is a high-capacity rail container to consolidate and carry less-than-truckload (LTL) cargo. It can carry up to 4 times more than a 40-foot container.

Featuring movable shelves for flexible loading, it can handle almost any cargo type and supports fully automated road-to-rail transfer. It is compatible with CargoBeamer systems.

CargoBeamer's CBoXX aims to redefine rail cargo transportation by providing a rail service for both LCL and LTL cargo.

Benefits

- **High efficiency and flexible storage** for any cargo size, enabling full loading unit accessibility.
- Enhanced cargo monitoring and **security with sensor integration options**.
- Fast, low-impact loading/unloading and fully automated multimodal transition.
- Compatibility with CargoBeamer technology for **seamless intermodal operations**.

Main beneficiary:

FREIGHT FORWARDERS

Technology readiness level : **8**
Implementation stage : **Pilot**

modularity

MultiRELOAD
PORT SOLUTIONS FOR SUSTAINABLE MOBILITY

LTL-Logistic provides a solution for customers with smaller shipment volumes, enabling them to benefit from the advantages of the intermodal transport.

By consolidating shipments and using the CBoXX as a loading unit, CargoBeamer offers a sustainable multimodal logistics solution tailored to the LTL and LCL transport needs of customers.

MultiRELOAD
PORT SOLUTIONS FOR SUSTAINABLE MOBILITY

Solution description

Innovative multimodal containers enable easy transfer of bulk goods, such as grain, fertiliser and chemicals, by road, rail and inland waterways.

They can be loaded from the top for bulk materials and from the front for palletised products.

Thanks to their pallet-wide design, they fit standard Euro pallets and are therefore suitable for almost any type of cargo.

Benefits

- **Flexibility & accessibility:** Increased operational flexibility and access to intermodal solutions.
- **Efficiency & cost savings:** Improved operations, cost efficiency, and reliability.
- **Sustainability & labour:** Environmental benefits and better working conditions.
- **Innovation & collaboration:** Support for innovative supply chains and shared solutions.

PORT SOLUTIONS FOR SUSTAINABLE MOBILITY

Solution description

RPIS is a key enabler of digital transformation in Europe’s multimodal logistics networks.

The **RiverPorts Planning and Information System (RPIS)** is a digital platform designed to optimize multimodal transport chains along international logistics corridors.

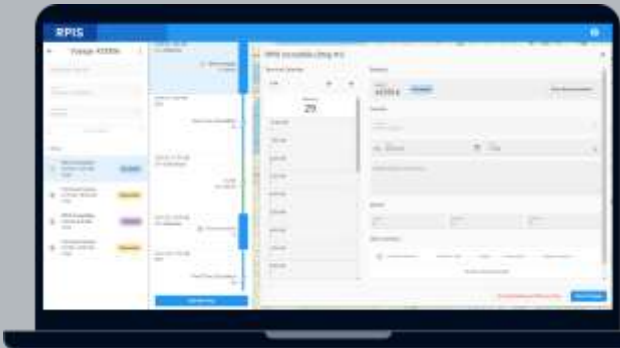

It connects stakeholders from inland waterways, rail, road, and terminals in real time, providing end-to-end transparency and supporting more efficient and sustainable transport operations.

Benefits

Seamless Integration	Connects all transport modes and systems across borders
Real-Time Insights	Provides live data and forecasts to optimize operations.
Scalable & Compatible	Modular setup aligned with EU PCS standards.
Process Automation	Digitizes workflows to reduce manual effort and errors.

IT Platform for multimodal planning

Developed by :

INFRABEL
Right On Track

Project by :

PIONEERS
Portable Innovation Open Network for
Efficiency and Emissions Reduction Solutions

RESULTS & IMPACTS

The aim of the IT-platform is to facilitate the modal shift by supporting the operational excellence.

The rail platform has a supporting IT role in following up and managing rail transport in and around the Port of Antwerp-Bruges. This requires an integrated and end-to-end approach in sharing data between all actors involved in the rail transportation. Hence the implementation of the rail platform.

Funded by the
European Union

This project has received funding from the European Union's Horizon Europe research and innovation programme under grant agreement No 101037564

connectivity and data

PIONEERS
Portable Innovation Open Network for
Efficiency and Emissions Reduction Solutions

Solution description

The IT platform provides a **centralized digital environment** enabling comprehensive data sharing and communication between all entities involved in multimodal freight operations at the Port of Antwerp-Bruges. It replaces existing manual logistics processes with digital workflows, allowing stakeholders real-time access to accurate supply chain data.

By integrating operational data across rail transport activities, the platform enhances coordination, optimizes rail infrastructure utilization, and facilitates transparent end-to-end logistics management.

Benefits

- Increased transparency and traceability of logistics processes
- Improved coordination among different transport operators
- Efficient utilization of available rail infrastructure
- Reduction of manual workload through process digitization
- Support of sustainability goals by promoting modal shift to rail

Main beneficiaries:

- Freight transport and Logistics operators
- Rail infrastructure management entities

OBJECTIVES

- Digitalization of existing manual processes
- Creation of transparency in the EzE supply chain through data collection and information exchange
- Effective coordination of the logistic processes of the various actors in the transport chain
- More efficient use of available rail infrastructure

MULTIMODAL TRANSPORT PLATFORMS FEDERATION AND ORCHESTRATION

Multimodality

Collaborative processes, connectivity and data

Solution description

Collaborative digital infrastructure that connects logistics stakeholders (carriers, forwarders, operators, and service providers) via secure, decentralised data exchange.

It supports API and SFTP, enabling real-time and query-based access to booking, transport, and emissions data.

Based on the XXP protocol, ReMuNet ensures interoperability, scalability, and GDPR-compliant communication across diverse IT systems in multimodal transport networks.

The platform federation acts as an authentication broker, enabling peer-to-peer data exchange as the system scales.

Benefits

- **Interoperability & Scalability:** Supports both direct and decentralized data exchange. Compatible with existing systems. Works across diverse stakeholder IT capabilities
- **Security & Compliance:** Cybersecurity by design: firewalls, access controls, encryption, virus scanning. GDPR-compliant data handling. Authentication brokering ensures secure, trusted information flows
- **Smart Logistics Integration:** Real-time and static data exchange on booking, traffic, emissions, capacity. Enables coordinated decision-making across modes and stakeholders. Reduces latency and overhead in multimodal transport planning

Main beneficiaries:
Carriers, LSPs, Infrastructure managers

- Real-time data on booking, traffic, emissions, and capacity.
- API and SFTP support for all system types.
- Secure, GDPR-compliant XXP-based data exchange.

ROUTING ALGORITHM ENABLING SYNCHROMODAL TRANSPORT CHAINS

Multimodality

Transport planning
and execution

Solution description

High-Performance Routing Algorithm that enables synchromodal door-to-door transport chains across Europe by integrating road, rail, inland waterway, and sea modes.

Key features include:

- Multimodal route optimization with real-time updates
- Simulation of disruptions (e.g., strikes, weather, infrastructure failures)
- Dynamic rerouting and cost-emission trade-offs
- Integration with timetable and relay transport data
- AI-based trailer swap coordination (MANSIO)

The system uses advanced graph models, Dijkstra's variants, and precomputed routing networks (HPR) to deliver fast, accurate, and scalable routing results.

Benefits

- Optimised multimodal routing improves logistics efficiency
- Reduces empty runs and enables door-to-door planning
- Supports modal shift to greener transport, cutting CO₂ emissions
- Real-time disruption management enhances resilience
- Balances cost, time, and emissions for optimal routing
- Seamlessly integrates with existing TMS and planning systems

Main beneficiaries:
LSPs, Freight Forwarders &
Shippers, Intermodal Operators
& Carriers

Multimodality

Collaborative
processes,
connectivity and data

Solution description

A **unified data pool** based on a standardised model that maps multimodal transport networks, integrating road, rail, inland waterways, and maritime modes.

It captures **static and dynamic data on goods, nodes, routes, and disruptions** within a single database, enabling structured, cross-sector information exchange and supporting resilient, interoperable transport planning and operations.

Benefits

- **Harmonises** data across transport modes and systems
- Enhances coordination and operational efficiency
- Enables real-time disruption monitoring and response
- Supports strategic planning and risk analysis
- Scales easily to new corridors and data sources
- Aligns with EU regulations for compliance and transparency
- Improves data-driven decision-making for all stakeholders

AGENT-BASED SIMULATION FOR RESILIENCE OF INTERMODAL TRANSPORTATION (ASTROIT)

Multimodality

Transport planning
and execution

Solution description

ASTROIT is a customizable simulation tool designed to model cargo transport as an agent-based system.

Each cargo unit (agent) autonomously selects the most optimal route from origin to destination based on user-defined cost minimization preferences (e.g., operational cost per km, CO₂ emissions per km, and travel time).

Benefits

- **Vehicle Customization:** Vehicles differ by type, capacity, speed, CO₂ emissions, and operational costs. They operate on specific, scheduled routes suitable for their type.
- **Dynamic Disruption Handling:** Network disruptions lower the performance of nodes/edges, increasing delays or causing total failure. Agents recalculate routes after a set reaction time.
- **Congestion Management:** Overloaded nodes trigger the spawning of additional vehicles on connecting routes to relieve congestion. These auxiliary vehicles are removed once normal conditions resume.
- **Full Customization:** Users can configure the network layout, vehicle characteristics, route schedules, and disruption scenarios at both node and edge levels.

Main beneficiary:
Carriers, LSPs, Infrastructure
managers

Solution description

A federated architecture enabling integration across multimodal passenger and freight transport platforms.

It is designed to facilitate research and development across sectors. This cloud-based framework supports data spaces and standardised interfaces, allowing users to co-develop services and components.

The architecture can be adapted to diverse technologies and facilitates collaboration in decentralised environments.

Benefits

- Decentralised architecture enables simultaneous multi-user collaboration
- Supports faster adaptation to market needs
- Enhances interoperability across platforms and systems
- Ensures secure data exposure and exchange
- Enables flexible integration of new components and services
- Cloud-based, leveraging data spaces for scalability and efficiency

Electrification

Solution description

Financial Assessment for Smart Planning of Megawatt Charging System (MCS) Hubs

The MCS Business Case Assessment Tool is an advanced simulation-based planning software aiming at helping stakeholders assess the financial viability and sustainability of MCS hubs by integrating investment costs, operational expenses, and potential revenue streams.

Designed for CPOs, energy providers and infrastructure planners it enables data-driven decision-making for deploying and scaling high-power truck charging infrastructure.

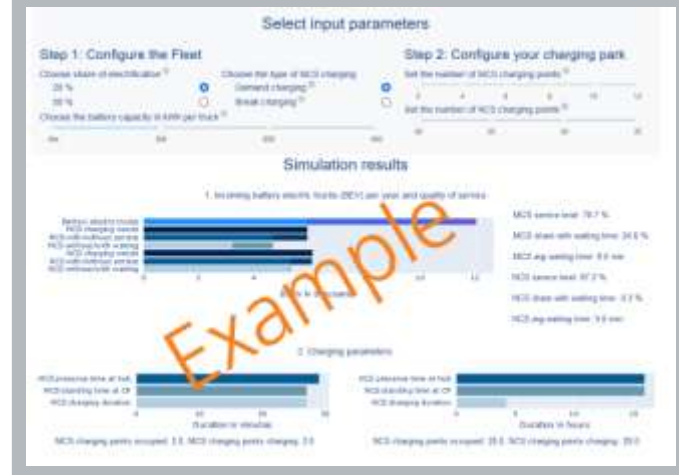

Benefits

- **Comprehensive simulation engine**
Combines CAPEX, OPEX, and revenue forecasting including auxiliary revenue (e.g., food, lodging, services) and TCO impact.
- **Dynamic price modeling**
Accounts for hourly energy prices and grid fees to reflect real-world operational contexts.
- **Scalable & transferable**
Adaptable to different regions and corridor configurations across the EU, accelerating market uptake of BE-HDVs by reducing uncertainty in deploying MCS hubs.

Benefits

- **Easy-to-Use LCA Tool:** Accessible for various stakeholders
- **Actionable Emissions Analysis:** Identify hotspots and improvement areas
- **Regionally Adaptable Analysis:** Tailor to specific contexts
- **Scalable & Transparent Solution**

Main beneficiaries:

Vehicle manufacturers,
Tier 1 Suppliers, Fleet operators,
Infrastructure Planners,
Policy Advisors

Jumpstart Electrification Decisions

Technology readiness level : **TRL 7**
Implementation stage : **Pilot**

Supply Chain Strategic Decisions tool for Resilience Fit

Cross-cutting IT systems and platforms

Digital Twins, AI and predictive technologies

Solution description

Resilience is not just about recovering to the original state but also about innovating and adapting to new realities.

Strategic fit, or the alignment between a company's environment and its strategic actions, is fundamental to supply chain resilience.

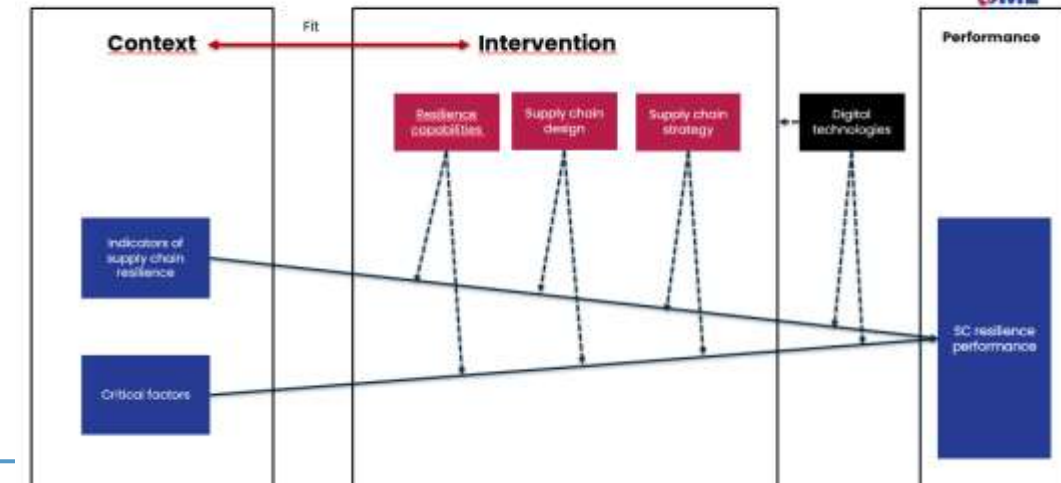

Benefits

The Supply Chain Resilience Fit Model helps to **understand how different strategic actions – SC design, SC strategies, resilient capabilities – taken by SC actors lead to improvements in supply chain resilience performance.**

The solution is aimed to all actors in the supply chain, with a special focus on SMEs

DISRUPTION INFORMATION INTERFACE FOR MULTIMODAL TRANSPORT

Cross-cutting IT
systems and
platforms

Collaborative
processes,
connectivity and data

Solution description

This tool is designed to collect and disseminate information about transport disruptions across three modes: road, rail, and sea.

It serves as an integration layer between various data sources and other transport management tools.

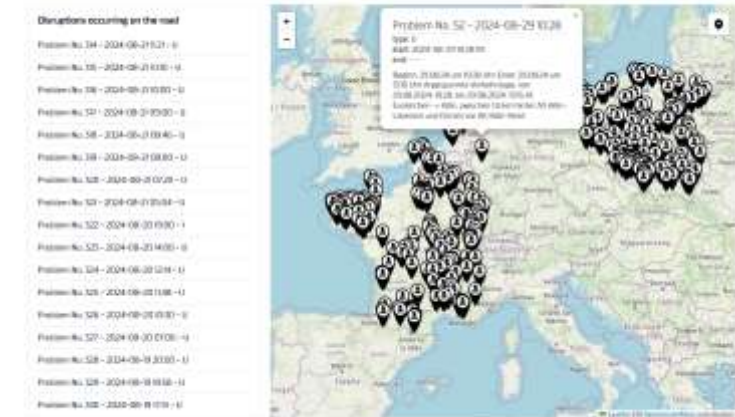

Benefits

- **Data Collection:** Gathers real-time disruption information from government APIs and industry platforms used by partners, via both active scraping and passive API submission.
- **Infrastructure & Storage:** Built with Python 3.11, Docker, PostgreSQL with PostGIS, and Elasticsearch for scalable deployment and robust data logging.
- **Disruption Insights:** Delivers detailed reports including location, timing, impact type, affected infrastructure, and predictive insights (e.g., estimated disruption end time via AI-based Survival Analysis).

Main beneficiaries:

Carriers, LSPs, Infrastructure managers, Public Authorities

ROUTE ENERGY & EMISSIONS INTELLIGENCE MODULE

Cross-cutting IT systems and platforms

Transport planning and execution

Solution description

The Energy Module is designed to estimate travel time, energy or fuel consumption, and emissions (CO₂ and NOx) based on road infrastructure and vehicle characteristics. Users can input data either manually or via an API.

The tool uses a speed model influenced by infrastructure features like speed limits, lanes, curvature, and vehicle details. Route options include user-defined paths or automatic shortest-path calculations. Results can be accessed through a web interface or a REST API, both requiring an API key from SINTEF for access.

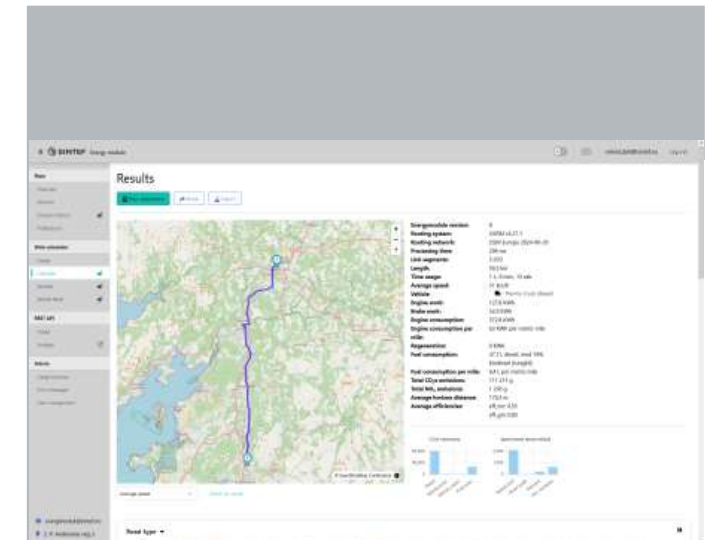

Benefits

- **Accurate Environmental Impact Analysis:** Provides precise estimates of energy consumption and emissions (CO₂, NOx), supporting greener transport planning.
- **Customizable and Flexible Routing:** Users can define routes manually or let the tool calculate the most efficient path based on infrastructure data.
- **Detailed Infrastructure Insight:** Considers road features (e.g., lanes, speed limits, tolls) to improve accuracy in route performance evaluation.
- **Interoperability via API:** Easily integrates with other models or systems through a REST API, enabling seamless data exchange.
- **Decision Support:** Assists policymakers, transport planners, and logistics operators in making data-driven, sustainable decisions.

Main beneficiaries:

- Carriers
- LSPs

Technology readiness level : 5
Implementation stage : *Pilot*

MODALNET: REAL-TIME DIGITAL TWIN FOR INTEGRATED FREIGHT MANAGEMENT

Cross-cutting IT systems and platforms

Transport planning and execution

Solution description

Tracking freight

ModalNET is a digital platform to monitor the logistics chain to provide a macro-level view of the freight flow, the transport modes and connected physical assets.

Additionally, it offers capabilities to perform the booking, create vessel schedules, and provide alternatives route options.

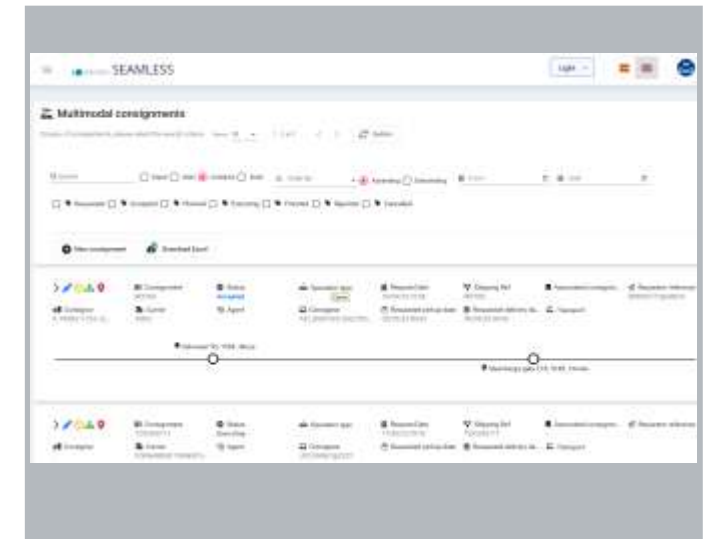

Benefits

- **Consignor** can make any booking through ModalNet and select the most suitable route and vessel
- **Freight-forwarders** managing different transport operations from different clients can monitor the real-time status
- **Shipping line** can offer their services through the platform

Main beneficiaries:

- Consignor
- Freight-forwarders
- Shipping lines

Technology readiness level : **7**
Implementation stage : **Pilot**
